Analyze Web server Using Webalizer in Fedora

Aim :

To analyze the usage and traffic statistics of an Apache web server using the webalizer web log analysis tool in Fedora.

Step :

1] Install Apache web server.

Sudo dnf install httpd -y

2] Start the server

Sudo systemctl start httpd

3] Enable Apache server.

Sudo systemctl enable httpd.

4] Check Apache status.

Sudo systemtl status httpd.

5] Open Apache server

http://localhost

6] Generate web traffic

Press Ctrl + R several times

7] Check Apache Access log.

Sudo tail /var/log/httpd/access_log

8] Create Webalizer Output Directory.

Mkdir -p ~/Desktop/server-report/apache-stats

9] Analyse Apache log.

Sudo Webalizer -F clf -o /home/student/Desktop/Server-report/apache /var/log/httpd/log.

10] Check Generated report.

ls -lh ~/Desktop/Server-report/apache-stats.

11] Open Webalizer Report.

firefox ~/Desktop/server-report/apache-stats/index.html

Result:-

The Apache webserver access log was successfully analyzed using webalizer and a graphical statistical report was generated successfully.
